HIV/AIDS

Definition: Respondents ages 18-64 that did not report having been tested for HIV.

Prevalence of Never Been Tested for HIV

- o South Dakota 71.4%
- o There is no nationwide median for never been tested for HIV

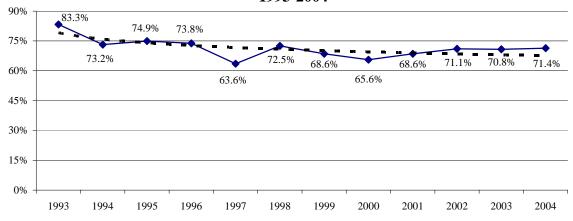

Healthy People 2010 Objective

There was no stated Healthy People 2010 Objective for never been tested for HIV.

Trend Analysis

Overall since this question was first asked in 1993 the percent of respondents who have never been tested for HIV has been decreasing. However, since 2001 the percent of respondents who have never been tested for HIV has been holding steady.

Figure 60
Percent of Respondents, Ages 18-64, Who Have Never Been Tested for HIV, 1993-2004

Demographics

Gender

There are no significant gender differences in regard to having ever been tested for HIV. However, it should be noted that males in the 18-24 age group exhibit a significantly higher prevalence of no HIV test than females of the same age. Furthermore, males in the central region also show a significantly higher prevalence of no HIV test than females in that region.

Age

The prevalence of those not ever having an HIV test varies greatly by age. Those in the 25-34 age group demonstrate the lowest prevalence of no HIV test and this prevalence is significantly lower than those in the 18-24 age group. However, each age group after 25-34 exhibits a significant increase in the prevalence of those who have never had an HIV test.

Race

Whites exhibit a significantly higher prevalence of no HIV test than do American Indians.

Region The northeast and central regions demonstrate a very high prevalence of no HIV

test, while the west and American Indian counties regions show a very low

prevalence.

Household Income The prevalence of no HIV test does not seem to follow any sort of a pattern as

household income increases.

Education The prevalence of no HIV test generally decreases as education increases. This

includes a significant decrease when the some post-high school level is reached.

Employment Status

Those who are employed for wages, self-employed, a student, or retired demonstrate a significantly higher prevalence of no HIV test than those in the other employment status groups.

Marital Status Those who are married or widowed exhibit a very high prevalence of no HIV test, while those who are divorced or separated show a very low prevalence.
